Figure 1 shows four schematic diagrams of the proposed architectures for a 16-bit multiplier. Each diagram illustrates the internal structure of the multiplier block, which takes two 16-bit inputs (A and B) and produces a 32-bit output. The architectures are labeled (a), (b), (c), and (d). Diagram (a) shows a multiplier block with a complex internal structure, including a 16-bit input A and a 16-bit input B, and a 32-bit output. Diagram (b) shows a multiplier block with a different internal structure, also taking 16-bit inputs and producing a 32-bit output. Diagram (c) shows a multiplier block with a simpler internal structure, taking 16-bit inputs and producing a 32-bit output. Diagram (d) shows a multiplier block with a different internal structure, also taking 16-bit inputs and producing a 32-bit output. The diagrams are labeled with their respective architectures: (a) 16-bit multiplier, (b) 16-bit multiplier, (c) 16-bit multiplier, and (d) 16-bit multiplier.
