

Redmi notes shows exception.

Maintenance process: when testing the function, it is found that the display is normal, but after the screen is turned off, it can't wake up by pressing the power-on button. After Accessories is excluded, there is no abnormality in diode value, and the measurement shows positive and negative 5v VCC, and it is found that VCC is insufficient.

Through the drawing search, it shows that the positive and negative 5v VCC is powered by the power supply

schematic showing positive and negative 5v parts
